PROMPT :-

HTML Generate a single HTML5 file named index.html that defines the structure for a "Group Idea Board" interface; it should contain a central container with a blue header titled "Group Idea Board," followed by an input section featuring a dropdown menu for names (labeled "Select your name..."), a text input field for ideas (labeled "Enter your idea here..."), and a blue "Add Idea" button, all positioned above a divider line and an unordered list (

-) containing three sample items—"Build a study planner," "Start a podcast," and "Organize a coding workshop"—ensuring the file correctly links to an external style.css and a script.js file at the bottom of the body. CSS Create a style.css file to replicate the clean, modern UI of the provided image, using a light grey background for the page and a white, centered card with a soft box-shadow and rounded corners for the board; the header should have a solid blue background with centered white text, the input area should use Flexbox to align the dropdown, text box, and "Add Idea" button in a single row with consistent padding and light grey borders, and the list items below should feature a horizontal separator, standard bullet points, and specific styling where the "suggested by" text is italicized and the user's name is bolded. JS Write a script.js file that adds interactivity to the Group Idea Board by selecting the dropdown, text input, and button elements to handle click events; the script must validate that a name is selected and the text field isn't empty before creating a new element, dynamically formatting the

content to match the pattern "Idea text — suggested by Name" using innerHTML, appending it to the existing list, and finally clearing the text input field so the user can immediately enter a new suggestion. Create a fully functional "Group Idea Board" web application using separate HTML, CSS, and JavaScript files that features a light/dark theme toggle and a main input area where users can type both their name and their idea. The interface should include an "Add Idea" button that prepends new entries to the top of a list and a "Reset Board" button to clear all data; each idea card must include a "Delete" button, a "Pin" button that highlights the card (e.g., with a distinct border or background) and moves it to the absolute top of the list, and a "Like/Dislike" system with visible counters. In the JavaScript logic, ensure that pinned ideas always maintain their position at the top, while all unpinned ideas are dynamically re-sorted by their "Like" count in descending order whenever a vote is cast. The CSS should provide a modern, responsive card layout with a blue header, smooth transitions for the theme swap, and clear visual indicators for pinned versus standard ideas. Add dynamic "Total Ideas" counter and a "Developed by Group 26" footer. Each generated idea card must display the name, idea text, formatted timestamp, a "Delete" button, and a "Pin" button that applies a distinct highlight (like a gold border). The JavaScript must implement a complex rendering logic where Pinned ideas are always anchored at the top of the list, while all unpinned ideas are automatically re-sorted in real-time by their "Like/Dislike" count (highest net likes first), with newly added ideas appearing at the top of their respective sections. Ensure the CSS uses Flexbox for a responsive layout, provides smooth transitions for the theme swap, and clearly distinguishes the interactive voting icons and their numerical counters. Create a fully functional main palette centered on a gradient derived from #fffdee (light accents/text) to #e3ef26 (bright highlights), accented by deep greens of #076653 and #06231d (header/footer/text). The website body should use professional, standard desktop proportions, featuring a main idea card with a blue header (using #076653), a dynamic "Total Ideas" counter, and a "Developed by Group 26" footer. To visualize the "ideas theme," implement a subtle animated CSS or JS background mimicking stylized lightbulbs, thought bubbles, or sparks of light floating behind the card. The interface must include a light/dark theme toggle, a sorting dropdown menu (with options for default (likes-dislikes), sort by time, and sort by likes), input fields for "User Name" and "Idea" capturing timestamps, an "Add Idea" button, and a "Reset Board" button. Each generated idea card must display the name, idea text, formatted timestamp, a "Delete" button, and a "Pin" button that applies a distinct highlight (e.g., gold border using #e3ef26). The JavaScript must manage the list state, ensuring that Pinned ideas are always anchored at the very top, while the remaining ideas are dynamically sorted based on the selected dropdown option (defaulting to the highest net score of likes-minus-dislikes). Ensure smooth transitions, professional spacing, and clearly identifiable interactive voting icons with numerical counters. Change the color pallet to maintain a professional and a minimalist look. Change the font colors to their corresponding theme for maximum visibility, only remove the sort by net score feature from the sorting menu.
